POPULATION SIZE, MIGRATION, DIVERGENCE, ASSIGNMENT, HISTORY
Bayesian inference using the structured coalescent
Migrate-n version 5.0.7 [May-01-2025]
Compiled for PARALLEL computer architectures
One master and 9 compute nodes are available.
Program started at Mon Jul 7 19:35:46 2025
Program finished at Mon Jul 7 19:36:46 2025 [Runtime:0000:00:01:00]

Options

Datatype: Single nucleotide polymorphism data(Hapmap formatting)

Inheritance multipliers in use for Thetas:
All loci use an inheritance multiplier of 1.0

Random number seed: (with internal timer) 3105322251

Start parameters:

Theta values were generated Using a percent value of the prior

M values were generated Using a percent value of the prior

Connection matrix:
m = average (average over a group of Thetas or M,
s = symmetric migration M, S = symmetric 4Nm,
0 = zero, and not estimated,
* = migration free to vary, Thetas are on diagonal
d = row population split off column population, D = split and then migration

Population 1
1 Japan *

Order of parameters:
1 Θ_1 <displayed>

Mutation rate among loci: Mutation rate is constant for all loci

Analysis strategy: Bayesian inference
 -Population size estimation: Exponential Distribution

Proposal distributions for parameter

Parameter	Proposal
Theta	Metropolis sampling
M	Metropolis sampling
Genealogy	Metropolis-Hastings

Prior distribution for parameter

Parameter	Prior	Minimum	Mean*	Maximum	Delta	Bins	UpdateFreq
1 Theta * *	Uniform	0.000000	0.050	0.100	0.010000	1500	0.50000

[* * means priors were set globally]

Posterior distribution:

Parameter values were collected using MCMC, these values were then used to generate the posterior histograms using KERNEL SMOOTHING (window=41) and subsequent SAVITZKY-GOLAY SMOOTHING (window=41) for combination over loci

Markov chain settings: Long chain

Number of chains	1
Recorded steps [a]	10000
Increment (record every x step [b])	100
Number of concurrent chains (replicates) [c]	1
Visited (sampled) parameter values [a*b*c]	1000000
Number of discard trees per replicate (burn-in * b)	100000

Multiple Markov chains:

Static heating scheme	4 chains with temperatures
	1000000.00 3.00 1.50 1.00
	Swapping interval is 1

Print options:

Data file:	infile.hapmap
	parmfile.hapmap
Haplotyping is turned on:	NO
Output file:	outfile_hapmap
Posterior distribution raw histogram file:	bayesfile
Raw data from the MCMC run:	bayesallfile.txt
Print data:	No
Print genealogies [only some for some data type]:	None

Data summary

Data file: infile.hapmap
 Datatype: SNP data (Hapmap data)
 Number of loci: 9

Mutationmodel:

Locus	Sublocus	Mutationmodel	Mutationmodel parameters
1	1	Jukes-Cantor	[Basefreq: =0.25]
2	1	Jukes-Cantor	[Basefreq: =0.25]
3	1	Jukes-Cantor	[Basefreq: =0.25]

Bayesian Analysis: Posterior distribution over all loci

Log-Probability of the data given the model (marginal likelihood)

Use this value for Bayes factor calculations:

$BF = \text{Exp}[\ln(\text{Prob}(D \mid \text{thisModel})) - \ln(\text{Prob}(D \mid \text{otherModel}))]$

or as $LBF = 2 (\ln(\text{Prob}(D \mid \text{thisModel})) - \ln(\text{Prob}(D \mid \text{otherModel})))$

shows the support for thisModel]

Locus	TI(1a)	BTI(1b)	HS(3)
1	0.00	0.00	0.00
2	0.00	0.00	0.00
3	0.00	0.00	0.00
4	0.00	0.00	0.00
5	0.00	0.00	0.00
6	0.00	0.00	0.00
7	0.00	0.00	0.00
8	0.00	0.00	0.00
9	0.00	0.00	0.00
All	-4.51	-4.51	-4.51

(1a) TI: Thermodynamic integration: $\log(\text{Prob}(D \mid \text{Model}))$: Good approximation with many temperatures

(1b) BTI: Bezier-approximated Thermodynamic integration: when using few temperatures USE THIS!

(3) HS: Harmonic mean approximation: Overestimates the marginal likelihood, poor variance

[Scaling factor = -4.511018]

Acceptance ratios for all parameters and the genealogies

Parameter	Accepted changes	Ratio
Θ_1	1859914/4500594	0.41326
Genealogies	4499406/4499406	1.00000

MCMC-Autocorrelation and Effective MCMC Sample Size

Parameter	Autocorrelation	Effective Sample Size
Θ_1	0.82080	8863.79
Genealogies	0.82080	8863.79

Average temperatures during the run

Chain	Temperatures
-------	--------------

1	1.00000
2	1.00000
3	1.00000
4	1.00000

Potential Problems

This section reports potential problems with your run, but such reporting is often not very accurate. With many parameters in a multilocus analysis, it is common that some parameters for some loci will not be informative. These parameters then trigger suggestions to increase the prior range that are not sensible. Do not blindly follow the suggestions given. If some parameters are flagged, inspect the tables carefully and judge whether an action is required. Suppose you run a Bayesian inference with sequence data for macroscopic species. In that case, there is rarely the need to increase the prior for Theta beyond 0.1. If you use microsatellites data, it is rather common that your prior distribution for Theta should have a range from 0.0 to 100 or more. With many populations (>3), it is also very common that some migration routes are estimated poorly because the data contains little or no information for that route. Increasing the prior range will not help in such situations, but reducing the number of parameters may help.

Genealogies 2: Effective sample size of run seems too short!
